Alleles of the varl locus on yeast mitochondrial DNA specify the size of varl ribosomal RNA. [1]: given sequence determines the smallest varl protein. The coding region is highly unusual: 89.6% of the total 'gc' rich palindromic cluster that accounts for 38% of the total 'gc' residues. results strongly suggest that like mammalian mitochondria but unlike those from Neurospora, yeast mitochondria use 'aua' as a methionine codon. Comparison with sequence of a varl allele specifying a larger protein suggests that some size polymorphism of varl protein results from in-frame insertions of a variable number of 'aat' (asn) codons. [1] compares sequence with that of the 42.0 allele of ds401.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 /transl_table=3

Alleles of the varl locus on yeast mitochondrial DNA specify the size of varl ribosomal RNA. [1]: given sequence determines the smallest varl protein. The coding region is highly unusual: 89.6% at with a 46 bp 'gc'-rich pallindromic cluster that accounts for 38% of the total 'gc'-residues results strongly suggest that like mammalian mitochondria but unlike those from Neurospora, yeast mitochondria use 'aua' as a methionine codon. Comparison with sequence of a varl allele specifying a larger protein suggests that some size polymorphism of varl protein results from in-frame insertions of a variable number of 'aat' (asn) codons. [1] compares sequence with that of the 42.0 allele of ds401.

The present sequence represents the large circular extrachromosomal

The present sequence of the Methanococcus janaschii circular chromosome. The

Lament sequence of the Methanococcus janaschii chromater present invention describes M. jannaschii open reading frames from the

genome sequence. The invention also describes a computer based system

for identifying fragments of the M. jannaschii genome that are

nonologous to target nucleotide sequence of the 1664976, 58407 or 16550

Describes M. jannaschii genome that are

means comprising the nucleotide sequence of the 1664976, 58407 or 16550

Describes M. jannaschii, or a nucleotide sequence at least 99.8 identical to it; (b) search means for comparing a target

sequence to the nucleotide sequence of the data storage means to

dentify a homologous sequence, and (c) retrieval means for obtaining

the homologous sequence. The method, which is based on whole genome

random sequencing of an autotrophic archaeon M. jannaschii, the genome

cof which consists of 3 physically distinct elements, a large circular

chromosome (the 1664976 bp sequence given in V21209), a large circular

extra-chromosomal element (the 88407 bp sequence given in

consists of sequence of the 1664976 bp sequence given in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

The DNA-spanner oligonuclecides BAM-36-198, BAM36-1980, RI36-198 and RI36-1980, comprise a modified 5'-nuclectide followed by a restriction site, and a long nuclectide sequence contgo a sequence at the 3'-end capable of annealing to a complementary sequence, at the 3'-end capable of annealing to a complementary sequence.

I.e. BAM36-198 and RI36-198 are complementary to BAM36-1980p and RI36-1980p, respectively. Binding a complementary pair of oligos to an anti-test protein antibody (Ab), which is then bound to the protein, allows the oligo sequences to form a primer template complex, which can be extended to form a double stranded duplex. The duplex can be digested with a restriction ensyme, the prods.

Separated and their band pattern detected, allowing a portion of the protein's amino acid sequence to be determined.

This method allows the determination of a protein sequence by epitope ordering with single, di- and tri-amino acid specific Abs, collowed by restriction mapping. The procedure provides enough protein sequencing to allow library screening oligo probes to be generated, and the corresp. CDNA clone to be PCR isolated. In addn. the epitope ordering procedure allows post translational modification events to be characterised.

The DNA-spanner oligonuclectides BAM-36-198, BAM36-198op, RI36-198

The DNA-spanner oligonuclectides BAM-36-198, BAM36-198op, RI36-198

The and RI35-198op, comprise a modified 5' neuclectide followed by a creatriction site, and a long nucleotide sequence contg. a sequence.

The and Capable of annealing to a complementary sequence.

The AM36-198 and RI36-198 are complementary to BAM36-198op and RI36-198 and RI36-198 are complementary to BAM36-198op and RI36-198 are complementary pair of oligos to an anti-test protein antibody (Ab), which is then bound to the complex, which an adouble stranded duplex.

The duplex can be digested with a restriction enzyme, the prods. Separated and their band pattern detected, allowing a portion of the protein's amino acid sequence to be determined.

This method allows the determination of a protein sequence by epitope ordering with single, di- and tri-amino acid specific Abs, collowed by restriction mapping The procedure provides enough and allows in allowing and intermediate provides enough.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             catggatagaaacagttcaacagtaagtacttcaaaaacaaaagcatcatggcaagaca 257

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          protein sequencing to allow library screening oilgo probes to be generated, and the corresp. CDNA flone to be PCR isolated. In addn. the cpitope ordering procedure allows post-translational modification events to be characterised.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequencing proteins by epitope ordering and protein restriction mapping - allows for characterisation of post-translational events on the protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        03-001-1996 (first entry)

DNA-spanner oligonucleotide BAM36-1980p.

DNA-spanner oligonucleotide, restriction site; anneal; hybridise; complementary sequence; anti-test protein antibody; extension; primer template complex; double stranded duplex; amino acid; sequence determination; epitope ordering; restriction mapping; ss.
                                                                                                                                                                                                   DNA-spanner oligonucleotide BAM36-198.
DNA-spanner oligonucleotide: restriction site; anneal; hybridise; complementary sequence; anti-test protein antibody; extension; primer template complex; double stranded duplex; amino acid; sequence determination; epitope ordering; restriction mapping; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Length 198;

the synthesis of an oligo primer which was further utilised for the isolation of a hybridising AGP gene from both N. alata and N. plumbaginafolia. Degenerate reverse primers corresp. to part of the AGP N-terminal AA sequence were synthesised and used to obtain a clob by primer extension product, which was then amplified by PCR. Additional primers, corresp. in sequence to parts of the 160-bp fragment were synthesised and used to amplify the 3 part of the SQP gene by nested PCR. The primers were 095536 and 095537. A clop gene by nested PCR. The primers were 095536 and 095537. A clop gene by nested PCR. The primers were 095536 and 095537. A clop gene shown. The PCR fragment encodes a protein contg. the peptide (R75513) by protein sequencing with two mismatches (see 092524 FT). The 1.6 kb PCR fragment was used to screen a cDNA ilbrary made from RNA isolated from N. alata cells. The alignment of the PCR sequences with the cDNA sequence gave rise to 092524.

The Calc. mol. wt. of the encoded protein is 51.8 kb with a predicted plot of 1600 pm.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              198 catggatagaaacagtttcaacagtaagtacttcaaaaacaaaagcatcatggcaagaca 257

A portion of the gene encoding the P. falciparum sporozoite antigenic protein CSP-2 (mol. wt. 42kD/54kD) was cloned. Clones 3, 4 and 6 were identified and found to contain malaria DNA inserts as represented in Q12514, Q12515 and Q12516 respectively. The polypeptides are present on the surface of the sporozoites and are cross-reactive with P. berghei antiserum. The Pf and Pb

The DNA-spanner oligonucleotides BAM-36-198, BAM36-1980p, RI36-198

C and RI36-1980p, comprise a modified 5'-nucleotide followed by a creatriction site, and a long nucleotide sequence contg. a sequence at the 3'-end capable of annealing to a complementary sequence, at the 3'-end capable of annealing to a complementary sequence.

C at the 3'-end capable of annealing to a complementary sequence.

C at the 3'-end capable of annealing to a complementary sequence.

C at the 3'-end capable of annealing a complementary pair of oligos to an anti-test protein antibody (Ab), which is then bound to the complex, which can be extended to form a double stranded duplex.

C The duplex can be digested with a restriction enzyme, the prode:

C The duplex can be digested with a restriction enzyme, the prode:

C The method allows the determination of a protein sequence by complexed allows the determination of a protein sequence by complexed by restriction mapping. The procedure provides enough contents of the protein sequencing to allow library screening oligo probes to be content of the protein sequencing to allow library screening oligo probes to be the content of the procedure provides enough the contents of the corresp. CDNA clone to be PCR isolated. In addn.

C The content of the corresp. CDNA clone to be PCR isolated. In addn.

C The content of the corresp. CDNA clone to be PCR isolated. In addn.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               catggatagaaacagttcaacagtaagtacttcaaaaacaaaagcatcatggcaagaca 257

The DNA-spanner oligonucleotides BAM-36-198, BAM36-1980p, RI36-198

The DNA-spanner oligonucleotides BAM-36-198, BAM36-1980p, RI36-1980 and RI36-1980 and RI36-1980 and a long nucleotide sequence contg. a sequence at the 3'-end capable of annealing to a complementary sequence, at the 3'-end capable of annealing to a complementary sequence.

Example 1980p, respectively. Blaid-1980 and complementary pair of oligos to an anti-test protein antibody (Ab), which is then bound to the protein, allows the oligo sequences to form a primer template complex, which can be extended to form a double stranded duplex. The duplex can be digested with a restriction enzyme, the prods. Separated and their band pattern detected, allowing a portion of the protein's amino acid sequence to be determined.

This method allows the determination of a protein sequence by protein sequencing to allow library screening oligo probes to be concated, and the corresp. CDNA clone to be PCR isolated. In addn. the epitope ordering procedure allows post-translational conditication events to be characterised.

A portion of the gene encoding the P. falciparum sporozoite antigenic protein CSP-2 (mol. wt. 42kb/54kb) was cloned. Clones 3, 4 and 6 were identified and found to contain malaria DNA inserts as represented in 012514, 012515 and 012516 respectively. The polypeptides are present on the surface of the sporozoites and are cross-reactive with P. berghei antiserum. The Pf and Pb proteins are substantially homologous, if not identical.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Claim 1; Page 64-66; 94pp; English.

DROME (DNN-binding regulator of c-myc expression) and FUSE (far upstream element) binding protein (FBP) are synonymous. A FUSE which is required for maximal transcription of c-myc binds a factor (DROME or FBP). The activator cis-element is approx. 1500 bp 5' of the human c-myc promoter Pl. A full length FBP CDNA sequence was assembled from overlapping clones obtd.from CDNA libraries. Source RNAS were from undifferentiated HL60 cells, the B lymphoma cell line, BJAB, and PMA/PHA stimulated pooled human peripheral blood lymphocytes (PSLS). A composite cDNA is given in Q68909 and the deduced polypeptide sequence, (67.5 kd mol. wt.) is given in R58813. Sequence 2384 BP; ATA A 488 C; 564 G; 560 T;

Deleted in Pancreatic Cancer locus 4 polypeptide - and related related acids, used in diagnosis and treatment of proliferative diseases, e.g. cancer of pancreas or other organs claim 4; page 65-67; l04pp; English.

The present sequence encodes the pure DPC4 (deleted in pancreatic cancer, locus 4) polypeptide. DPC4 is a tumour suppressor gene. Detection of truncated DPC4 protein, or of homozygous deletions or intragenic mutations in the encoding nucleic acid, is used to diagnose intragenic mutations in the encoding nucleic acid, is used to diagnose (in vivo or in vitro) proliferative diseases, especially pancreatic carcinoma, bile duct, bladder or colorectal cancer, Crohn's disease, colitis-associated meoplasia or chronic ulcerative colitis. These conditions, where associated with a homozygous deletion, can be treated by administering an agent that: (a) modulates DPC4 expression, specifically a sense DPC4 sequence (particularly in the form of a vector, i.e. by gene therapy), but also an antisense sequence where the protein is over expressed or (b) mimics the activity of DPC4. DPC4 presence/absence of human chromosome 18q21. I fragments. When a contain such a deletion. This agent exploits the absence of an enzyme contain such a deletion. This agent exploits the absence of an enzyme contain such a deletion. This agent exploits the absence of an enzyme contain such a deletion.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                State as Lumour intraction brights.

State as Lumour intraction brights.

DROME (DNA-binding regulator of c-myc expression) and FUSE (far upstream element) binding protein (FBP) are synonymous. A FUSE which is regulated for maximal transcription of c-myc binds a factor (DROME or FBP). The activator cis-element is approx. 1500 bp 5' of the channer c-myc promoter Pl. A full length FBP cDNA sequence was assembled from overlapping clones obtd. From cDNA libraries. Source RNAs were from undifferentiated HL60 cells, the B lymphoma cell line, BNAS, and DNAA/PAR stimulated pooled human peripheral blood the CALME of Lymphocytes (PBLS). A composite cDNA is given in 066909 and the clones from a BJAB cDNA library and three clones from a BJAB cDNA library and three clones from the Same BJAB library and two clones from the activated human PBL cDNA library contain the sequence in 068909.

Three clones from the same BJAB library and two clones from the activated lymphocyte library are lacking bps 316,317 and 318 cativated human lacking these three bps would encode a sequence 2381 BP; 769 A; 488 C; 564 G; 559 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       2207 AAATGTATTTGCAATTATGTGGTTGATGCTTTGTGATATAAATGTACTTTTTCAATGTAT 2266
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         2267 ACTITCACITICCAAATGCCIGITITGIGCTTTACAATAAATGATATGAAAACCTCAAAAA 2326

This sequence represents the Proj3 gene of Plasmodium. Proj3 belongs to the Duffy binding like (DBL) family of genes which have homology to the Duffy antigen binding protein (DABP) and sialic acid binding protein (DABP) and sialic acid binding protein (DABP) and sialic acid binding protein (SABP) conserved regions (see T72889 and T72888 respectively). The var family of genes modulate cytoadherence and antigenic variation of Plasmodium infected erythrocytes. SABP and the Duffy antigen binding protein (DABP) are soluble proteins that appear in the culture supernatant after infected erythrocytes release merozoites. DABP and SABP confiate the binding of merozoites and schizonts to the erythrocyte surface. These proteins are necessary for erythrocyte invasion by the parasite. This sequence can be used in the compositions of the invention. The compositions are for the treatment and prevention of malaria, and computes either a nucleotide sequence or encoded polypeptide of the car.1, var-2, var-3 or var-7 genes of the DBL gene family, a family of

                                                                                                                                       genetic studies of the chloroquine resistance locus. The 4 genese Balt-oi (083254) and proj3 (083528) and proj3 (083528) and proj3 (083528) and proj3 (083528) and proteins given in R70233-36, respectively. The bindin domains of such proteins can be expressed e.g. in E. coli, yeast, mammalian, insect, and in vaccinia virus and adenovirus-infected cells, and provide protection against P. falciparum. Sequence 820 BP. 3194 A; 1249 C; 1777 G; 2000 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New malaria vaccines - contains cysteine-rich DBL family protein binding domains homologous domains of the Duffy and sialic acid

This sequence represents the var-7 gene of Plasmodium. Var-7 belongs to the Duffy binding like (DBL) family of genes which have homology to the Duffy antigen binding protein (DABP) and sialic acid binding protein (DABP) and sialic acid binding protein (SABP) conserved regions (see T72889 and T72888 respectively). The var family of genes modulate cytoadherence and antigenic variation of Plasmodium infected erythrocytes. SABP and the Duffy antigen binding protein (DABP) are soluble proteins that appear in the culture supernatant after infected erythrocytes rolease merozoites. DABP and SABP mediate the binding of marzozoites and schizonts to the erythrocyte surface. These proteins are necessary for erythrocyte invasion by the parasite. This sequence can be used in the compositions of the invention. The compositions are for the treatment and prevention of malaria, and
genes having homology with conserved regions of DABP and SABP. The compositions are used for the treatment and prevention of malaria. They are also used in the preparation of vaccines for inducing a protective immune response in a mammal to Plasmodium merozoites (especially Plasmodium faliciparum or Plasmodium vivax).

                                                                                                                                                                                                                                                          ö
comprise either a nucleotide sequence or encoded polypeptide of the var-1, var-2, var-3 or var-7 genes of the DBL gene family, a family of genes having homology with conserved regions of DABP and SABP. The compositions are used for the treatment and prevention of malaria. They are also used in the preparation of vaccines for inducing a protective immune response in a mammal to plasmodium merozoites (especially Plasmodium falciparum or Plasmodium vivax).
                                                                                                                                                                                                                                                                                                                                        15410 ATTTATATTAAAAAAGAAATATAAAAACAAATTTATTAAAATGAAAAAAGAAAAATGAA 15469

/ Organism="Homo sapiens"
/ Organism="Homo sapiens"
/ Organism="Topic site_1: Not1; Site_2: EcoRI; Ist Strand cDNA was primed with oligo(dT)17 on 50 mg of DNAse-treated, total cellular RNA obtained from 5.000-10,000 microdissected, histologically normal prostate epithelial cells. Double-stranded cDNA was ligated to EcoRI adaptors, 5 cycles of PCR applied to the CDNA with an adaptor-specific primer, and the resulting PCR product subcloned into pAMP10 by the UDG-cloning method (Life Technologies). Average insert size is 600 bp. NOTE: Not directionally cloned. This library was constructed by David Krizman."

                                                                                                                                   This sequence is unfinished. It consists of 1 contigs for which the order is known. The lengths of the gaps have been estimated by the submitter but are not known exactly. When sequencing is complete, the sequence data presented in this record will be replaced by a single finished sequence with the same accession number.

1 99687: contig of 99687 bp in length.

Genes were identified by a combination of three methods: Gene prediction programs including GRAIL (available by anonymous ftp from arthur repm.orn!gov), Genefinder (Phil Green, University of Washington), Genscan (Chris Burge, http://gnomic.stanford.edu/-chris/GENSCANW.html), and NetPlantGene (http://www.cbs.dtu.dk/netpgene.chbant), searches of the complete sequence against a peptide database and the Arabidopsis EST database at TIGR (http://www.tigr.org/tdb/at/at.html). Annotated genes are named to indicate the level of evidence for their annotation. Genes with similarity to other proteins are named after the database hits. Genes without significant peptide similarity but with EST similarity are named as 'unknown' proteins. Genes without protein or EST similarity, that are predicted by more than two gene prediction programs over most of their length are predicted by tRNAscan-SE (Sean Eddy, TRNAscan-SE (Sean Eddy, TRNAscan-SE (Sean Eddy, TRNAscan-SE (Sean Eddy, TRNAscan-SE) simple repeats are identified by repeatmasker (Arian Smit, http://fpr.genome.wustl.edu/eddy/tRNARepeatMasker.html). Regions of exons by GRAIL are annotated as misc features.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             complement(join(835. .1212,1373. .1513,1600. .1693, 1789. .1845,1933. .1994,2162. .2407,2492. .2548,2640. .2697, 2855. .3038,3239. .3405,3479. .3531,3790. .3871,3980. .4045, 4167. .4353,4486. .4549,4633. .4842,4938. .5006,5088. .>5654), /gene="F13M22.2".

BAC clone F13M22 is from Arabidopsis chromosome II and is near the
molecular marker ve018.
The orientation of the sequence is from SP6 to T7 end of the BAC
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             'note="exon predicted by xgrail, quality marginal"
